1 GOCPI package

1.1 Submodules

1.2 GOCPI.CreateCases module

```
class GOCPI.CreateCases.CreateCases
     Bases: object
     A class of methods to create user-defined data cases
     set_accumulated_annual_demand(accumulated forecast)
          Sets the accumulated annual demand for fuels per region over the forecast period.
             This function relies on a similar forecasting methodology as set specific demand.
             Fuels set in this function cannot be defined in set specific demand.
             Parameters accumulated_forecast (float, array) - The forecast array
                 of size (len(region),len(fuel),len(year))
     set_accumulated_fuel(accumulated_fuel)
          Sets the case's accumulated fuel types
             Parameters specified_fuel (list) - list of specified fuels
     set_annual_emission_limit(annual emission limits)
          Sets Annual Emission Limits
             Parameters annual_emission_limits (float, array) - Annual Emis-
                 sion Limits
     set_annual_exogenous_emission(annual_exogenous_emission)
          Sets Annual Exogneous Emissions
             {f Parameters annual\_exogenous\_emission} \ (float, array) - {f Annual Ex-}
                 ogenous Emissions
     set_availability_factor(availablility_matrix)
          Sets the availability factors
             Parameters availablility_matrix (float, array) - Matrix describing
                 availability factors for given technologies
     set_availability_technology(availability_technology)
          Sets the cases availability technology type
             Parameters availability_technology (list) - List of technologies
     set_capacity_factor(factor matrix)
          Sets capacity factors for conversion technologies.
```

Parameters factor_matrix (float, array) -

set_capacity_of_one_technology_unit(capacity_of_one_technology_unit)
Set the capacity of one technology units for all technologies

Parameters capacity_of_one_technology_unit (float, array) - capacities for one technology units

set_capacity_technology(capacity_technology)
Sets the cases capacity_technology type

Parameters capacity_technology (list) - List of technologies

set_capacity_to_activity_unit(region, technology, capacity_dictionaries, override)
Sets the capacity to activity parameter

Parameters

- region (list) List of regions
- technology (list) List of technologies
- capacity_dictionaries (list) List of dictionaries to assign value
- override (float, array) -

set_capital_cost(capital_costs)

Sets capital costs

 ${f Parameters}$ capital_costs (float, array) - capital cost paramters

set_capital_cost_storage(capital_cost_storage)

Sets the capital costs of using storage technologies

 $\begin{tabular}{ll} \bf Parameters \ capital_cost_storage \ (\it{float} \ , \ \it{array}) - capital \ cost \ of \ storage \ technologies \end{tabular}$

set_conversion_ld(timeslice, daytype, link)

Sets the Conversionld parameter

Parameters

- timeslice (list) List of timeslices
- daytype (list) List of daytypes
- link (dict) Dictionary describing the connection between timeslices and daytypes

set_conversion_lh(timeslice, dailytimebracket, link, override)

Sets the Conversionlh parameter

Parameters

- timeslice (list) List of timeslices
- ullet dailytimebracket (list) List of dailytimebracket
- link (dict) Dictionary describing the connection between timeslices and dailytimebrackets
- override (int, array) Override if want to manually put in the array

set_conversion_ls(timeslice, season, link)

Sets the Conversionls parameter

Parameters

- timeslice (list) List of timeslices
- season (list) List of seasons
- ullet link (dict) Dictionary describing the connection between timeslices and seasons

set_daily_time_bracket(num_dailytimebrackets)
Creates set of daily time brackets

 ${\bf Parameters \ dailytimebracket} \ ({\it int}) - [{\rm description}]$

set_day_split(daily_time_bracket, years, hour_split, num_days, num_hours)
Sets the day split parameter

Parameters

- daily_time_bracket (list) List of daily time brackets
- years (list) List of year
- hour_split (dict) Dictorary of hours in a daily time bracket
- num_days (int) Number of days in a year
- num_hours (int) Number of hours in a day

set_days_in_day_type(season, daytype, year, link, override) Sets the DaysInDayType parameter

Parameters

- season (list) List of seasons
- daytype (list) List of daytypes
- year (list) List of years
- link (dict) Dictionary relating seasons to daytypes
- override (int, array) Override if want to manually put in the array

set_daytype(num_daytypes)
[summary]

 ${\bf Parameters} \ {\tt num_daytypes} \ ({\it int}\,) - {\tt Number} \ {\tt of} \ {\tt daytypes}$

set_depreciation_method(region, methods, override)

Sets DepreciationMethod (1 = Sinking Fund Depreciation, 2 = Straightline Depreciation)

Parameters

- region (list) List of regions
- ullet override (int, array) Manual array for setting depreciation methods
- methods (dict) Dictionary assigning methods to regions

[summary]

Parameters

- equity (dict) Dictionary of equity totals from treasury balance sheets
- debt (dict) Dictionary of equity totals from treasury balance sheets
- market_index (int, array) Regional monthly index returns (Arrays)
- \bullet cost_of_debt_pre_tax (dict) Dictionary of pre-tax cost of debts calculated from treasury balance sheets
- risk_free_rate (dict) Dictionary of risk free rates from 10 year swap rates for each region
- ullet effective_tax_rate (dict) Dictionary of company tax rates for each region
- ullet preference_equity (dict) Dictionary of preference equity for each region
- market_value_preference_shares (dict) Dictionary of the market value of prefence shares for each region
- ullet preference_dividends (dict) Dictionary of prefence dividends for each region
- ullet market_risk_coefficient (dict) Dictionary of markey risk coefficients

 ${\bf Returns}\,$ Numpy array of discount rates

Return type [int, array]

set_emission(emissions)

Sets the cases emission types

Parameters emissions (List) – list of emission types

set_emission_activity_ratio(emission activity ratios)

Sets Emission Activity Ratios

Parameters emission_activity_ratios ([float, array) - Emission Activity Ratios

set_emissions_penalty(emissions penalties)

Sets Emissions Penalties

Parameters emissions_penalties (float, penalties) - Emissions Penalties

set_fixed_cost(fixed costs)

Set fixed costs

Parameters fixed_costs (float, array) - fixed cost parameters

set_fuel(fuel)

Sets the case's fuel types

Parameters fuel (list) – list of fuels

set_input_activity_ratio(input_activity_ratios)

Sets input activity ratios

Parameters input_activity_ratios (float, array) - Sets the input activity ratio

```
Parameters minimum_storage_charges (float, array) - minimum stor-
           age parameters
set_mode_of_operation(num modes of operation)
    Create the number of modes of operation (n = 1, ..., num \mod s)
        {f Parameters num\_modes\_of\_operation} ( int ) -
set_model_period_emission_limit(model period emission limits)
    Sets Model Period Emission Limits
        Parameters model_period_emission_limits (float, array) - Model
           Period Emission Limits
set_model_period_exogenous_emission(model period exogenous emissions)
    Sets Model Period Exogenous Emissions
        Parameters model_period_exogenous_emissions (float, array) -
           Model Period Exogenous Emissions
set_operational_life(operational lives)
    Sets operational life
        Parameters operational_lives (list) -
set_operational_life_storage(operational life storage)
    Sets the operational life storage
        Parameters operational_life_storage (float, array) - operational
           life storage parameters
set_output_activity_ratio(output activity ratios)
    Sets output activity ratio
        Parameters output_activity_ratios (float, array) - output activity
           ratio parameters
set_re_min_production_target(re min production targets)
    Sets Renewable Energy Minimum Production Targets
        Parameters re_min_production_targets (float, array) - Renewable
           Energy Minimum Production Targets
set_re_tag_fuel(re tag fuels)
    Sets RE Tag Fuels
        Parameters re_tag_fuels (float, array) - RE Tag Fuels
set_re_tag_technology(re tag technologies)
    Sets RE Tag Technology
        Parameters re_tag_technologies (float, array) - RE Tag Technolo-
           gies
```

set_min_storage_charge(minimum storage charges)

Sets the minimum storage charges

set_region(regions)

Sets the datacase's regions analysis

Parameters regions (list) – list of regions

set_reserve_margin(reserve margins)

Sets reserve margins

Parameters reserve_margins (float, array) - Reserve Margins

set_reserve_margin_tag_fuel(reserve_margin_fuel_tags)

Sets the reserve margin tag fuels

Parameters reserve_margin_fuel_tags (float, array) - Sets the reserve margin tag fuel parameters

 $\verb|set_reserve_margin_tag_technology(|reserve_margin_tag_technologies)||$

Sets Reserve Margin Tag Technology

Parameters reserve_margin_tag_technologies (float, array) - Reserve Margin Tag Technologies

set_residual_capacity(residential_capacities)

Set residual capacity

Parameters residential_capacities (float, array) - residual capacities parameter

set_residual_storage_capacity(residual_storage_capacities)

Sets residual storage capacities

Parameters residual_storage_capacities (float, array) - residual storage capacities

set_season(num seasons)

Creates set of seasons

Parameters num_seasons (int) - Number of seasons

set_specified_annual_demand(specified forecast)

Sets the annual demand for fuels per region over the forecast period (Must be accurate)

Parameters forecast (float, array) - The forecast array of size (len(region),len(fuel),len(year))

set_specified_demand_profile(specified_annual_demand, region, fuel, year, timeslice, profile, override)

Sets the specified annual demand profiles using the specified annual demand.

Parameters

- specified_annual_demand (float, array) Specified annual demand profiles
- region (list) List of regions
- fuel (list) List of fuels
- year (list) List of years
- timeslice (list) List of timeslices
- profile (Dict) Dictionary of fuel allocations to timeslices

• override (float, array) - Manual override for the specified annual demand profiles.

set_specified_fuel(specified_fuel)

Sets the case's specified fuel types

Parameters specified_fuel (list) – list of specified fuels

set_storage(storage)

Sets storage set of the datacase

Parameters storage (list) – list of storage types

set_storage_level_start(storage level start)

Sets the storage level starting point

Parameters storage_level_start (float, array) - storage starting level

set_storage_max_charge_rate(storage_max_level_charge_rates)

Sets the storgae max charge rate

Parameters storage_max_level_charge_rates (float, array) - Storage max level charge rates

set_storage_max_discharge_rate(storage_max_level_discharge_rates)

Sets storage technologies maximum discharge rates

Parameters storage_max_level_discharge_rates (float, array) - Discharge rates for storage parameters

set_technology(technology)

Sets the cases technology type

Parameters technology (list) - List of technologies

set_technology_from_storage(technology_from_storage)

Sets technology from storage binary paramter

Parameters technology_from_storage (float, array) - technology from storage parameter

set_technology_to_storage(technology to storage)

Sets the technology to storage parameter

Parameters technology_to_storage (float, array) - technology to storage parameter

set_timeslice(timeslice)

Set of timeslices

Parameters timeslice (list) – list of timeslices

set_total_annual_max_capacity(total_annual_max_capacities)

Sets the total annual maximum capacities

Parameters total_annual_max_capacities (float, array) - Total Annual Max Capacities

set_total_annual_min_capacity(total_annual_min_capacities)
Sets the total annual minimum capacities

Parameters total_annual_min_capacities (float, array) - Total Annual Min Capacities

set_total_technology_annual_activity_lower_limit(total_technology_activity_lower_limits)

Sets the Total Technology Activity Lower Limits

Parameters total_technology_activity_lower_limits (float, array) - Technology Activity Lower Limits

set_total_technology_annual_activity_upper_limit(total_technology_annual_activity_upper_ Sets the Total Technology Activity Upper Limits

Parameters total_technology_annual_activity_upper_limits (float, array) - Technology Activity Upper Limits

set_total_technology_period_activity_lower_limit(total_technology_period_activity_lower_ Sets Total Technology Period Activity Lower Limits

Parameters total_technology_period_activity_lower_limits ([type]) - Total Technology Period Activity Lower Limit

set_total_technology_period_activity_upper_limit(total_technology_period_activity_upper_ Sets Total Technology Period Activity Upper Limits

 $\begin{aligned} \textbf{Parameters total_technology_period_activity_upper_limits} \ (\textit{float} \ , \\ \textit{array}) - \textbf{Total Technology Period Activity Upper Limit} \end{aligned}$

set_trade_route(trade)

Sets the TradeRoute parameter between regions (Assume it is the same across fuels and years)

Parameters trade (int , array) – 4D array representing trade relationships between regions, fuels and years. You must model this manually.

set_variable_cost(variable_costs)
Sets variable costs

Parameters variable_costs (float, array) - variable costs parameters set_year(start_year, end_year, interval)

Sets a list of forecast years

Parameters

- start_year (int) Starting year for forecasting (Less than end_year)
- end_year (int) Ending year for forecasting (Greater than start_year)
- interval (int) Gap for forecasting period

set_year_split(timeslices, years, splits)

Creates 2D Numpy Array Parameter Splits. (Note: The index positions of timelices and splits must match)

Parameters

- timeslices (list) List of timeslices
- years (list) List of years
- splits (dict) A dictionary linking yearsplits to timeslices

1.3 GOCPI.Energysystems module

class GOCPI.Energysystems.Energy_Systems(year, region, emission, technology, capacity_technology, availability_technology,
fuel, specified_fuel, accumulated_fuel,
timeslice, mode_of_operation, storage,
daytype, season, dailytimebracket)

Bases: object

A class of methods to initialise energy systems and create the data/model files needed for optimisation.

create_data_file(file_location, defaults_dictionary, toggle_defaults)
Creates the osemosys datafile

Parameters

- file_location (str) String of directory to save data file
- defaults_dictionary (dict) Dictionary setting the default values for parameters
- toggle_defaults (Bool) Boolean (True/False to only print the default functions

create_model_file(root, file)

Creates the model file necessary for the project to run

Parameters for the basic problem (*Parameters*) – Returns The loaded in parameters and sets

load_datacase(case, system)

Loads the data case to a correct configured and intialised energy system

(The load status dictionary must be compatible with the data_case and system_case)

Parameters

- case (object) Energy system datacase
- system (object) Initialised energy system
- load_status (dict) Dictionary setting the required sets and parameters to load

Returns Returns the updated dictionary

Return type system case (dict)

1.4 GOCPI.Forecasting module

class GOCPI. Forecasting. Forecasting

Bases: object

calculate_cagr_forecasts(cagr_dictionary, base_year_dictionary, fuel, year)

Forecasts base year fuels by a constant average growth rate for a forecast period

Parameters

- cagr_dictionary (*Dict*) Dictionary of constant average growth rates per fuel
- base_year_dictionary ([type]) Dictionary of base year fuel consumption in energy types
- fuel (list) List of Fuels
- year (list) List of forecast years

Returns 2D Array of demand forecasts per fuel

Return type [float, array]

Calculates the constant average growth rate $(\overline{C}AGR)$

Parameters

- start_year (int) Starting year
- end_year (int) Ending year
- start_value (int) Initial value
- \bullet end_value (int) Final value

Returns Constant average growth rate (1+ decimal)

Return type cagr

energy_balance_base(root,

IEA World Energy Balances 1,

 $IEA_World_Energy_Balances_2$, $create_excel_spreadsheet$, $output_file$)

Creates the baseline energy balance for forecasting

Parameters

- root (path) Path to provide access to all the files

- \bullet create_excel_spreadsheet (boolean) True/false on whether to create a spreadsheet
- output_file (str) Name of output energy balance spreadsheet

Returns Dictionary of energy balances and unique lists (Use these key words to access: Energy Balances, Fuel, Geography, Technology)

Return type (dict)

1.5 GOCPI.Navigation module

class GOCPI.Navigation.Navigation(target root, target file)

Bases: object

Navigation is a class for navigating, manipulating and editing data in the GOCPI model.

Find_File

Type string

TODO: Fill out all functions below

Find File()

Find_File searches for a target file, from a base directory, to construct a target directory.

Inputs: target_root = The base directory to search from (string). target_file = The name of the target file (string).

Outputs: f = Combinated target file location (string).

create_linear_programme_file(directory, data_file, model_file, output_file)
Creates the model file through executing model system commands

Parameters

- directory (str) Name of directory to put data into
- data_file (str) Name of energy system data file
- model_file (str) Name of energy system model file
- output_file (str) Name of output linear programme

1.6 GOCPI.Optimisation module

class GOCPI.Optimisation.Optimisation

Bases: object

Prepare and runs optimisation with IBM ILOG CPLEX Optimisation Studio

create_linear_programme_file(directory, data_file, model_file, output_file)
Creates the model file through executing model system commands

Parameters

- directory (str) Name of directory to put data into
- data_file (str) Name of energy system data file
- model_file (str) Name of energy system model file
- output_file (str) Name of output linear programme

reset(tarinfo)

Resets the tarfile information when creating tar files This is to input into the filter when using tar.add()

Parameters tarinfo (Object) – Tar Object containing an ID of 0 and the root as the name

Returns Tar Object containing an ID of 0 and the root as the name **Return type** tarinfo (Object)

run_cplex_local(model_file)

This function runs cplex on the local device if the energy system is of a small enough complexity

```
run_ibm_wml_do(apikey, url, deployment_space_name, cloud_object_storage_credential, service_instance_id, deployment_space_exists, data_assets_exist, data_asset_dictionary, model_name, model_type, model_runtime_uid, model_tar_file, num_nodes, deployment_exists, payload_input_data_id, payload_input_data_file, payload_output_data_id)
```

This function enables the user to solve python-based optimisation models. The legacy offering to solve optimisation models on IBM cloud was using the docplex python api to run Cplex on DOcloud. As of September 2020, the DOcloud was discontinued with Decision Optimisation functionalities imported to IBM's Watson Machine Learning Service. The new process requires the energy system model to be written in python. This project saw the implementation of the osemosys modelling methodology in GNU Mathprog written into LP Files. IBM Decision Optimisation in cannot deploy models in LP File formats to get jobs. Therefore, this function is for future work in converting the entire energy system modelling tool to python-based only. This is well-documented the report in the Future Work Section. Note: You must have access to IBM Watson Studio and Cloud Products through the IBM Academic Initiative or Similar.

Parameters

- apikey (str) API key from user's IBM Cloud Account
- url ([type]) URL for the server the user is using for the IBM services
- deployment_space_name (str) Name of the deployment space
- ullet cloud_object_storage_credential (str) Credential for the cloud object storage asset
- service_instance_id (str) Service instance id for the service being used (IBM WML)
- deployment_space_exists (boolean) True/False if the deployment space already exists
- data_assets_exist (boolean) True/False if the data assets (e.g. input data stored on cloud)
- ullet data_asset_dictionary (dict) A dictionary of data assets to stored on IBM cloud
- $model_name (str) Name of the model$
- model_type (str) Name of the model
- model_runtime_uid (str) Runtime ID for the model
- model_tar_file (tar) Tar file containing the python model
- num_nodes (int) Number of nodes the model is run off.
- deployment_exists (boolean) True/False if the deployment already exists
- payload_input_data_id (str) Name of input data

- payload_input_data_file (dataframe) Input data file in the form of a dataframe
- ullet payload_output_data_id (str) Name of output data file

use_bash_shell(command)

Execute bash commands in python scripts

Parameters command (str) - Command to execute

1.7 Module contents

Indices and tables

- genindex
- \bullet modindex
- \bullet search

Python Module Index
